

Construction Management Services

Noriker delivers a complete suite of Construction Management services and activities, guiding a renewable energy project from initial pre-construction phases through to successful operation.

Our specialised Construction Management service builds directly upon our experience providing EPC management services to all the BESS and hybrid projects we have developed, and includes developing the project programme, strict Health & Safety compliance, cost control, risk mitigation, and stakeholder interface management.

Our technical and project management expertise enables us to offer a tightly-controlled risk profile with the economic benefits of direct procurement. This is increasingly valuable as the market moves from full turnkey solutions to split-contract models where the risk profile is shifted towards the asset owner.

As both a construction manager and engineering integrator we are uniquely positioned to retain oversight over project interfaces, and ensure any engineering, technical or construction issues are resolved in the best interests of the asset owner and their long-term asset strategy.

Noriker's extensive experience in green-field project development, and integration engineering capabilities, differentiates us from other service providers.
